CONTENTS

What's inside

1	**What this app does** The idea in one page
2	**Getting started** Open the app and sign in
3	**Finding your way around** The sidebar, screen by screen
4	**Your first project, step by step** From documents to an approved plan
5	**Talking to the AI assistant** What to type and what happens next
6	**How tasks get assigned** The allocation engine, simply explained
7	**Progress, fairness and changes** Verified progress, leave, re-planning
8	**Trust and safety** Approvals, roles and the audit trail
9	**Tips and troubleshooting** Quick fixes and good habits

Before you start

The demo account is shared. Please **don't change its password or delete shared data**, so the next person can use it too.

SECTION 1

What this app does

Teams struggle to share out work fairly. Someone has to weigh each person's **skills**, **availability**, **current workload** and the **project's priorities** — and then redo it all whenever something changes. This app does that work for you, explains every decision, and lets a human approve anything important.

It keeps answering five questions:

Question	What answers it
Who should do each task?	The allocation engine scores every person and suggests the best fit.
What should each person do next?	The AI assistant gives each person a short, prioritised to-do list.
Is work really progressing?	Verified progress — only work a manager has accepted counts.
Is the workload fair?	Load bars and a fairness score show who is overloaded.
What happens when something changes?	Report it in chat; the app proposes a new plan for you to approve.

> **In one line**
>
> **Skills** + **Availability** + **Workload** + **Priorities** → fair task allocation, real-time adjustment and a clear reason for every choice.

SECTION 2

Getting started

You only need a web browser (Chrome, Edge, Firefox or Safari) and an internet connection. Nothing to install.

1 **Open the website**
Go to teamcodesilk-vyuham-26-5p3x.vercel.app. It works on a laptop or a phone, but a laptop is easier for planning.

2 **Stay on the “Sign in” tab**
The sign-in card has three tabs: **Sign in**, **New company** and **Join company**. For the demo, use **Sign in**.

3 **Enter the demo account**
Username: `admin` · Password: `1234567890`

4 **Press “Sign in”**
You'll land on the **Dashboard**, with the AI chat ready to use.

Field	Type this
Username or email	`admin`
Password	`1234567890`

The other two tabs

- **New company** — sets up a fresh, empty workspace for your own organisation. You become its admin.
- **Join company** — lets a team member join a workspace that already exists, as staff.

> **Who is the demo account?**
>
> The demo account is an **admin**, so you can see and try everything: projects, approvals, the workforce view and the audit trail. A **staff** user sees only their own tasks and records.

SECTION 3

Finding your way around

Everything lives in the **sidebar** on the left. Screens refresh on their own every 10–15 seconds, so you don't need to reload.

Screen	What you do there
Dashboard	Your home. Key numbers at a glance, plus the **AI chat** — the fastest way to do almost anything.
Projects	Create projects, upload documents (briefs, specs, requirements), and review the spec and plan the AI prepares.
Allocation	See who is assigned to which task and why. Run allocation and approve or reject suggestions.
Workforce	Everyone's current load. Spot who is overloaded or free, and check the fairness score.
Profiles	Each person's skills, skill scores and evidence (such as public GitHub work), availability and history.
Audit	A permanent, tamper-evident record of every decision. Use **Re-verify chain** to prove nothing was changed.
Settings	Workspace and account options.

> **Tip**
>
> Not sure where something is? Just **ask the chat** on the Dashboard — for example, “Show me who is overloaded.”

SECTION 4

Your first project, step by step

This is the full loop, start to finish. Steps marked ✓ **Approve** wait for a person before anything changes.

1. **Create a project and upload documents**
   Open **Projects**, create a project, and upload the project's documents (PDF, Word or text).

2. **Let the AI read them**
   In chat, type “Analyze the documents and prepare the execution plan.” The AI reads everything and asks questions where something is unclear — for example, if one document says 8 weeks and another says 12.

3. **Answer its questions**
   Reply in plain words, e.g. “The deadline is 12 weeks.”

4. **✓ Approve the spec**
   The AI shows a summary of what the project needs. Check it and approve.

5. **✓ Approve the plan**
   The AI breaks the work into tasks with priorities and order. Approving creates the tasks (only once).

6. **Run allocation**
   Open **Allocation** and run it, or ask in chat. Each task gets a suggested owner with a reason.

7. **✓ Approve flagged assignments**
   Some suggestions need a human look, e.g. when someone would be close to full. Approve or change them.

8. **Work and submit**
   Staff see their tasks, ask the chat what to do next, and submit finished work.

9. **✓ Accept deliverables**
   A manager accepts finished work. Only then does it count towards verified progress.

10. **Handle changes**
    If someone is away or priorities change, tell the chat. It proposes a new plan for you to approve.

SECTION 5

Talking to the AI assistant

The chat on the Dashboard is the easiest way to use the app. Type normally — no special commands needed.

Things a manager can say

Manager Analyze the documents and prepare the execution plan.

Manager Who is overloaded this week?

Manager Vikram is on sick leave for 3 days.

Manager Why was this task given to Vikram?

Things a staff member can say

Staff What should I prioritize today?

Staff I've finished my current task — what's next?

What happens after you ask

- **Questions** get a straight answer, built from your real project data.
- **Anything that changes data** (a leave, a reassignment, a new plan) shows up as an **approval card**. Nothing changes until someone presses **Approve**.
- Every approval is written to the **Audit** trail.
- The chat only shows what your role allows — staff never see admin-only information.

Tips for good results

Be specific. Name the person, task or project.

One request at a time gives cleaner answers.

Ask “why?” — every suggestion has a reason you can read.

Check before approving. The AI suggests; you decide.

If the AI service is unavailable, the chat switches to a simpler **offline mode** that still uses real data. Its answers are labelled.

SECTION 6

How tasks get assigned

The assignment engine is plain, rule-based logic — it doesn't guess. It works in three stages:

Stage	What happens
1. Filter	People who can't do the task are removed: missing a required skill, unavailable, or already too busy.
2. Score	Everyone left gets a **suitability score** from six weighted factors, such as skill match, availability and current load.
3. Approve	The top choice is suggested with its reason. Borderline cases are sent to a person to approve.

Workload limits

Load after assignment	What the app does
Under 85%	Assigns normally.
85% – 95%	Flags it — a manager must approve.
Over 95%	Blocks it, to stop people being overloaded.

Admins can adjust how much each factor counts. Every change to these weights is recorded in the audit trail.

SECTION 7

Progress, fairness and changes

Verified progress

The app doesn't trust “90% done”. Only work a manager has **accepted** counts as verified. Bigger and more important tasks count for more:

Priority	Weight
Critical	1.5×
High	1.2×
Medium	1.0×
Low	0.8×

Self-reported progress is shown alongside, but never added to the verified figure.

Fairness

The **Workforce** screen shows each person's load and a **fairness score** (Gini index). Closer to 0 means work is spread evenly; higher means a few people carry most of it.

When something changes

1. **Tell the chat**
   e.g. “Vikram is on sick leave for 3 days.”
2. **✓ Approve the leave card**
   This marks the person as unavailable.
3. **Review the new plan**
   The engine suggests who should pick up the affected tasks.
4. **✓ Approve the reassignments**
   Tasks move, and every change is logged.

SECTION 8

Trust and safety

Feature	What it means for you
Human approval	The AI never changes important data on its own. You approve every plan, reassignment and leave.
Role-based access	Staff see only their own records; managers see their projects; projects are kept separate.
Audit trail	Every decision is chained with SHA-256 hashes. Editing any past entry breaks the chain, and **Re-verify chain** on the Audit screen shows it straight away.
Safe documents	Text inside uploaded files is treated as data, never as instructions to the AI. Suspicious instructions are flagged.
Explanations	Every assignment comes with a reason you can read and question.

> **Try it**
>
> Open **Audit** and press **Re-verify chain**. A pass means no recorded decision has been altered.

SECTION 9

Tips and troubleshooting

Problem	What to try
Can't sign in	Check you're on the **Sign in** tab. Type `admin` and `1234567890` exactly, with no spaces.
Screen looks out of date	Wait a few seconds (it refreshes every 10–15 s) or reload the page.
Chat answer is labelled “offline”	The AI service is busy or unavailable. Answers still use real data; try again shortly for richer replies.
Chat says I'm not allowed	Your role can't do that action. Ask a manager or admin.
A task wasn't assigned	Nobody suitable had enough capacity. Adjust deadlines, add people, or approve a flagged option.
Upload fails	Keep files small and in PDF, Word or text format.
Plan seems wrong	Ask the chat “why?”, correct its assumption, and regenerate before approving.

Good habits

- Upload clear, up-to-date documents — the plan is only as good as what it reads.
- Keep skills and availability in **Profiles** current.
- Accept finished work promptly so progress stays accurate.
- Report leave and priority changes in chat as soon as you know.

The whole app in one line

Sign in → upload documents → ask the chat to plan → approve spec and plan → run allocation → work and accept → report changes.
